About Us

Emthunzini Hats was started seven years ago and remains a solely owned and family operated business, specialising in women's, men's and children's hats. Our extensive range is designed in Australia to give you serious sun protection while making you look great. We are proud of the high quality of our hats and we work hard to ensure you get the best value for your money, despite the sometimes challenging global market conditions.

MEDUNSA

Most samples of most Emthunzini hats are tested by the Photobiology Laboratory at MEDUNSA and carry the in vitro SPF Test Certificate, symbolising that they have undergone the SPF-testing procedure as developed by Diffey and Robson, and meet the requirements of the Australian and South African test methods on the Optometrics SPF 290 Analyzer.

ARPANSA

We are committed to providing quality products made from High Grade ARPANSA (Australian Radiation Protection & Nuclear Safety Agency) approved materials.

MOSTLY WASHABLE & CRUSHABLE

Ideal for travelling! You can pack and flatten most of our hats into your suitcase or backpack and they simply bounce back on arrival.

HAT SIZING

Ladies hats are generally size 58 cm. Men's hats are sizes 61 cm or 63 cm, unless otherwise specified.

CANCER SEAL OF RECOGNITION

Most Emthunzini Hats have been awarded the Cancer Association of South Africa (CANSA) Seal of Recognition (CSOR) symbolising that our products offer the assurance of protection against the harmful effects of the sun. Hats that carry the UPF50+ swing ticket have been specially tested and verified as meeting the UPF50+ requirements.

UPF TESTING

UPF testing involves exposing a fabric to Ultraviolet Radiation (UVR) and measuring how much is transmitted through the sample. Different wavelengths of radiation in the UVR spectrum have different effects on human skin and this is taken into consideration when calculating the UPF rating.

HATS THAT YOU CAN SEE THROUGH OR HAVE "HOLES" IN THEM

The holes in the fabric will make a difference depending on whether the fabric absorbs or scatters the UVR. It is difficult to tell how protective clothing is by looking at it or holding it up to the light because the human eye responds to visible radiation and not to UVR, and the transmission through fabrics in the visible range is often higher than in the UVR range.

Laboratory UPF testing simulates a worst case situation, where the UVR is incident at right angles to the fabric and transmission is therefore maximal. In general wear situations, clothing often provides protection in excess of the UPF rating because the incoming UVR will be a range of different angles and only at right angles a fraction of the time.

Thus, when consumers see a UPF label on an item of clothing, they can be confident about the listed level of protection.

Hat Videos

30 second video clips are available on How to pack; How to wash; How to spot wash and How to stlye your Emthunzini hats. To view these fun video clips, please email sales@sunhats.com.mt.
